

# AI Co-Pilot

*Kurudunje Deekshith Shetty*

For this project, I utilized AI-copilot tools to assist with various tasks, primarily focusing on debugging Java code and refining the phrasing of my report. I did not require it much for AWS console tasks which I found to be easy to figure out. My key usage was in:

## Debugging Java Code:

- Since I am not very familiar with Java, I encountered several errors while writing and executing my code.
- I used GenAI tools to analyze error messages and suggest possible fixes.
- This significantly reduced the time I spent troubleshooting and helped me understand the underlying issues better.

## Enhancing Report Clarity:

- While writing my report, I used GenAI tools to rephrase and refine my sentences for better readability and coherence.
- This was particularly useful in ensuring that my explanations were clear and concise without altering the intended meaning.

Overall, the AI-copilot tools were quite useful in making the debugging process more efficient and improving the quality of my written communication. They helped streamline my workflow and allowed me to focus on understanding concepts rather than being stuck on syntax or phrasing issues.
